A scanning electron microscope (SEM) is a type of electron microscope that produces images of a sample by scanning the surface with a focused beam of electrons. The electrons interact with atoms in the sample, producing various signals that contain information about the surface topography and composition of the sample. The electron beam is scanned in a raster scan pattern, and the position of ...

JB-4® Plus Embedding Kit JB-4® Plus Embedding Kit for light microscopy is a water soluble, GMA based, plastic resin kit intended for use in the preparation of embedded samples for high resolution light microscopy. Its cooler acting accelerator system offers greater heat protection of tissue components. It yields semi-thin sections (0.5 - 2µm) with excellent morphological preservation.

Abstract. Lead halide perovskites have been demonstrated as high performance materials in solar cells and light-emitting devices. These materials are characterized by coherent band transport expected from crystalline semiconductors, but dielectric responses and phonon dynamics typical of liquids.
